

# Verification of Digital Designs: Week 2

Martin Schoeberl

Technical University of Denmark  
Embedded Systems Engineering

September 7, 2021

# Overview

- ▶ More on tooling
- ▶ Some more Scala (+ repetition)
- ▶ An example test of an ALU
- ▶ Regression tests and continuous integration
- ▶ Presentation of reading material
- ▶ Lab: test an accumulator (from the Leros processor)

## Tools: git and GitHub

- ▶ git is a distributed version-control system
- ▶ You *may* also use GitHub as code host
- ▶ `git clone path` local copy from a server
- ▶ `git pull` get updates
- ▶ `git commit -a -m "message"` add your changes locally
- ▶ `git push` push to the server
- ▶ `git add filename` add a file to the repo
- ▶ Always start with `git pull`
- ▶ Concurrent edits are merged on a line-by-line bases
- ▶ When sharing text, have manual line breaks to minimize chances of conflict

## Tools: make

- ▶ `make` is for automation
- ▶ A list a dependencies and commands to run
- ▶ Can become complex
- ▶ Keep it simple just to remember commands
- ▶ Look into `chisel-example`

# Using make

- ▶ Run it with:
  - ▶ `make`
- ▶ Run a target:
  - ▶ `make target`
- ▶ Targets are described in a Makefile
  - ▶ `target: dependency`
  - ▶ `[tab] command`
- ▶ Let us explore it now
- ▶ Install make and write a simple Makefile

# Scala Values and Variables

```
// A value is a constant
val i = 0
// No new assignment; this will not compile
i = 3

// A variable can change the value
var v = "Hello"
v = "Hello World"

// Type usually inferred, but can be declared
var s: String = "abc"
```

# Simple Loops

```
// Loops from 0 to 9
// Automatically creates loop value i
for (i <- 0 until 10) {
  println(i)
}
```

# Scala Classes

```
// A simple class
class Example {
  // A field, initialized in the constructor
  var n = 0

  // A setter method
  def set(v: Int) = {
    n = v
  }

  // Another method
  def print() = {
    println(n)
  }
}
```

# Functions

```
class Example {  
    def compute(a: Int, b: Int): Int = {  
        a + b  
    }  
}
```

- Last expression is the return value

# Functions

```
class Example {  
  
  def complexCompute(a: Int, b: Int, c: Int):  
    Int = {  
  
    def add(x: Int, y: Int) {  
      x + y  
    }  
  
    add(a, b) + c  
  }  
}
```

- ▶ We can define local functions
- ▶ To better organize our code

# Functions

```
class Example {  
    def complexCompute(a: Int, b: Int, c: Int):  
        Int = {  
            def add() {  
                a + b  
            }  
            add() + c  
        }  
}
```

- Local functions have access to outer variables

# Regression Tests

- ▶ Tests are collected over time
- ▶ When a bug is found, a test is written to reproduce this bug
- ▶ Collection of tests increases
- ▶ Runs every night to test for *regression*
  - ▶ Did a code change introduce a bug in the current code base?

# Continuous Integration (CI)

- ▶ Next logical step from regression tests
- ▶ Run all tests whenever code is changed
- ▶ Automate this with a repository, e.g., on GitHub
- ▶ Run CI on Travis (with GitHub integration)
- ▶ Show about this on the Chisel book
  - ▶ Show `sbt test`
  - ▶ Mails from travis
  - ▶ Live demo on travis
- ▶ <https://travis-ci.com/schoeberl/chisel-book>

# Lab Time I: Write a ScalaTest

- ▶ Setup a Scala project with `build.sbt`
- ▶ ScalaTest: write a test suit to test `Int` that  $2 + 3 = 5$ , and two more integer tests
- ▶ Maybe add a `Makefile`

## Lab Time II: Test the accumulator

- ▶ ALU + register
- ▶ Exhaustive testing is not an option
- ▶ Corner cases plus random

## Lab Time III: CI with Travis

- ▶ Create a repo on GitHub
- ▶ Add the ALU plus your tester
- ▶ Connect it with Travis
- ▶ you need a `.travis.yml`
- ▶ Look into the Chisel book source for an example
